

Portfolio page. [Project Page](#)

Recommendation is to use bootstrap on this project. The visual aesthetics of the page will be evaluated with the expectation of a bootstrap site. If you would rather not use bootstrap please be sure your own CSS skills can create a clean looking site. You are welcome to use a different CSS tool such as foundation. Simply understand this is expected to be a clean page.

This will be what is referred to as a Single-Page site. This site should include the following:

- ☐ Minimum of three sections.
- ☐ A navbar with a navigation element for each section.
- ☐ Clicking on the nav item should bring me to the section in question.
- ☐ A footer section is not counted as one of the three sections however should be included
- ☐ Include clickable items that will take the user to your social media items. Minimum of 2 should be there but feel free to include all your social media items.
- ☐ Include an external link to your tribute page in some way.
- ☐ Placeholders for future items are encouraged feel free to use <https://placeholder.it/> for image place holders.

Additional challenges

- ☐ Mobile friendly - if using bootstrap be sure the page is set for mobile friendly usage. (hacker level improves on this)
- ☐ Dropdown menu element - create subsections inside one of your sections update the nav element to include jumps to these subsections.

Hacker level challenges - you will need to research elsewhere to accomplish these.

- ☐ Make your navbar mobile friendly. The navbar should turn into a menu option on mobile devices.
- ☐ Include CSS Media queries to change some of the elements for mobile viewing.
- ☐ Include an audio only or video element to the site. This could be something such as an audio file of yourself talking about a coding concept or a screencast of you coding something for example. Be creative.
- ☐ Use animate.css to give some animation to your page. This will give you experience using other CSS libraries on your pages.
